JOSEANE PEREIRA

Software Engineer

Aveiro, Portugal | +351 935 202 600 | joseaneper62@gmail.com | joseane772.github.io | github.com/Joseane772

PROFILE

I am an MSc graduate in Computer and Telematics Engineering (University of Aveiro) with hands-on backend and systems experience. I have built a C#/.NET REST API against a non-relational database, deployed to the cloud and unit-tested, and, for my thesis, software that detects congestion on a 5G network and responds automatically in real time, which required analysing the network core's own C code to find where congestion signalling was missing. I am comfortable working inside large, unfamiliar codebases, and I care about code that is tested, documented, and reproducible rather than merely working.

EDUCATION

MSc in Computer and Telematics Engineering, University of Aveiro *(2024–2026, thesis grade 16/20)* **BSc in Computer and Informatics Engineering**, University of Aveiro *(2021–2024)*

EXPERIENCE

AWS Product API, Sky Careers technical assessment · 2024 I designed and built a product-management REST API in C# (ASP.NET Core) against AWS DynamoDB, with a Docker Compose setup for local development and a unit test suite, in one week. This was a technical challenge within a recruitment process, not employment. It covered data modeling, endpoint design, and cloud deployment under a tight deadline.

Mobile Network Systems Orchestration, MSc Thesis · 2024–2026 I built software that monitors a 5G network in real time, detects congestion, and responds automatically by controlling user admission and reshaping traffic priorities. To do it I integrated a commercial management platform with an open-source network core through its metrics, database, and control interfaces, analysed the core's C code to find where congestion signalling was missing, and built a traffic-shaping service with Linux traffic control (tc/HTB) driven by Prometheus metrics. Delivered as a reproducible, documented, tested artifact published on GitHub.

Team Lead, Deloitte Tech Experience · Lisbon · 2024 I led a 5-person team building a document-grounded chatbot on the OpenAI API, implementing retrieval-augmented generation (embeddings and vector search) so answers were constrained to a defined document set. Short bootcamp programme, not employment.

Tech across these: C#, ASP.NET Core, Python, C, Java, REST APIs, AWS DynamoDB, MongoDB, Docker Compose, Prometheus, Linux, Git

SKILLS

Backend & APIs: C# (.NET, ASP.NET Core), Python, C/C++, Java; REST API design; OOP, data structures; unit testing.

Data: non-relational databases (MongoDB, AWS DynamoDB); SQL and data modeling.

AI / LLM: OpenAI API integration, prompt engineering, retrieval-augmented generation (embeddings, vector search).

Cloud, Systems & Tools: AWS (hands-on); Docker Compose (local development); Linux administration (Arch/CachyOS daily driver); virtual machines; Git; agile methodologies.

Frontend: JavaScript, React, HTML.

PROJECTS

On GitHub (github.com/Joseane772): the full thesis artifact, a C# REST API, an ANTLR-based compiler in Java (lexer, parser, semantic analysis, code generation), a Three.js 3D application, and actively maintained Linux system configuration.
